LOW-CODE EXPERIMENT 12

Implementing Security Features and Governance / Administration Practices in Zoho Creator

Patient Appointment Booking System

Thanashree G R

Register Number: 241501262

Department: Artificial Intelligence and Machine Learning (AIML)

1. Aim

To implement and review security features and governance practices in Zoho Creator by configuring user permissions, validating mandatory fields, and defining controlled data sharing for the Patient Appointment Booking System.

2. Introduction

Security and governance help ensure that patient information is accessible only to appropriate users. Zoho Creator provides permission sets to control access to application modules, mandatory-field validation to prevent incomplete submissions, and data-sharing rules to define which roles can view or manage records. For this application, the receptionist permission set is already configured, and the data-sharing screen is used to prepare a rule for sharing Patient Registration records with the appropriate role.

3. Requirements

- A computer with internet access and a modern web browser.
- A Zoho account with access to the Zoho Creator application.
- The Patient Appointment Booking System application.
- A Patient Registration form with mandatory fields configured.
- Existing user permission sets and roles, including Receptionist Access.

4. Procedure

Step 1: Sign in to Zoho Creator and open the Patient Appointment Booking System application.

Step 2: Open Settings and select User Permissions.

Step 3: Review the existing permission sets. The Receptionist Access permission set is already available, so it does not need to be created again.

Step 4: Open the Data Sharing tab and select Add Rule.

Step 5: In the New Share Rule panel, enter a descriptive rule name, select the Patient Registration form, and choose the source and recipient roles.

Step 6: Choose an appropriate access level. Read Only is suitable when receptionists need to view shared records without editing them.

Step 7: Save the rule after confirming that the source role, recipient role, and access level are correct.

Step 8: Test the form by submitting it without a required field. Zoho Creator should block the submission and display an invalid-entry or mandatory-field message.

5. Implementation Screenshot

Figure 1 shows the New Share Rule panel for the Patient Registration form. The rule name, source role, recipient role, and access level are the fields to configure before saving. The screenshot records the configuration stage; it does not indicate that the rule has already been saved.

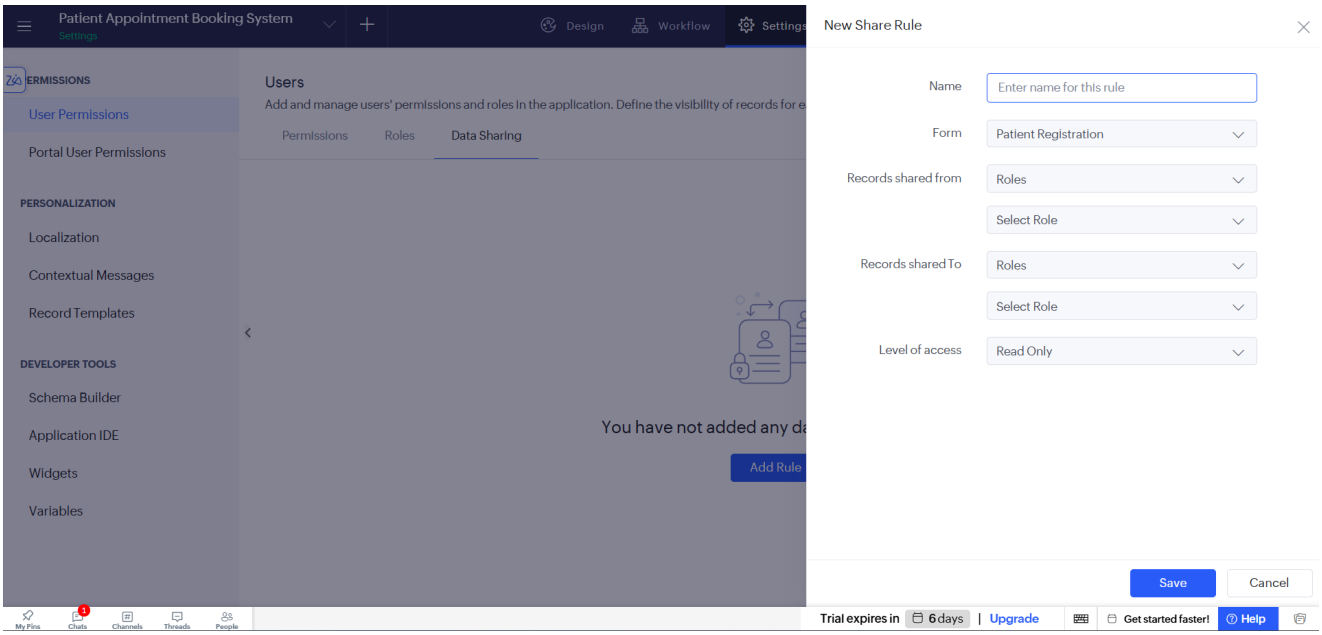

Figure 1: New Share Rule panel in Zoho Creator for the Patient Registration form.

6. Result

The security and governance configuration for the Patient Appointment Booking System was reviewed. Existing Receptionist Access permissions were identified, mandatory-field validation was tested, and the data-sharing rule configuration was opened for Patient Registration. The sharing rule should be saved only after the correct source and recipient roles are selected.

7. Conclusion

This experiment demonstrates how permissions, mandatory-field validation, and data-sharing rules support safer administration of a low-code patient appointment application. Applying least-privilege access helps protect patient records while allowing authorised reception staff to perform their tasks.
