EXPERIMENT 8

Configuring User Management and Role-Based Access Control (RBAC) in Zoho Creator

Name: Thanashree G R

Roll No: 241501262

Aim

To configure user permissions and role hierarchy for the Patient Appointment Booking System in Zoho Creator, creating a custom permission set and a Receptionist role.

Software Required

Zoho Creator and the Patient Appointment Booking System application.

Procedure

1. Open the application Settings and navigate to User Permissions.

2. Review the existing Read and Write permission sets.

3. Select Add Permission and create a permission set named Receptionist Access with a description for reception staff.

4. Configure the Patient Registration module access options according to the intended receptionist responsibilities. The selected permission set is saved and appears in the permissions list.

5. Open the Roles tab and add a role named Receptionist with the description “Handles patient registration and appointment requests.”

6. Set Receptionist to report to CEO and retain the role hierarchy.

7. Open the Share dialog and confirm that Receptionist Access is available in the Permission dropdown. Do not share the application unless an intended user email is supplied.

8. Capture screenshots of the saved permission set, role hierarchy, role details, and permission assignment option for the lab record.

Configuration Summary

Permission set: Receptionist Access
Role: Receptionist
Reports to: CEO
Share Data with Peers: No
Associated users: None at the time of capture.

Result

A custom Receptionist Access permission set and Receptionist role were created in Zoho Creator. The role hierarchy places Receptionist under CEO, and the custom permission set is available in the application-sharing permission list. No user was assigned or invited, so end-user access restrictions were not tested.

Screenshots and Evidence

Screenshots below show the actual configuration screens captured during the experiment.
