LOW-CODE EXPERIMENT 5

Building Reports, Dashboards and Custom Pages (UI Builder) in Zoho Creator

Application: Patient Appointment Booking System

Name: Thanashree G R

Roll No.: 241501262

Department: AIML

Abstract

This experiment demonstrates the creation of reports and a dashboard in Zoho Creator for a Patient Appointment Booking System. A Patient Registrations report is used to view saved patient records, while an Appointment Schedule Report displays the patient name, department, preferred appointment date, preferred appointment time and appointment type. A custom dashboard brings together summary cards, charts and the appointment report so that the records can be reviewed from one page.

1. Aim

To create and view reports and design a dashboard in Zoho Creator that summarizes patient registration and appointment information using actual application records.

2. Introduction

Reports present submitted form records in a structured format, while dashboards combine data summaries and visualizations in one interface. Zoho Creator's UI Builder allows components such as panels, charts and reports to be arranged on a custom page. In this experiment, the dashboard is designed to provide a quick overview of patient registrations and appointment preferences.

3. Reports Created

3.1 Patient Registrations: The existing report displays submitted patient records in a tabular view.

3.2 Appointment Schedule Report: A report was created using Patient Registration data with the fields Patient Name, Department, Preferred Appointment Date, Preferred Appointment Time and Appointment Type. This allows appointment preferences to be reviewed together.

4. Dashboard Design (UI Builder)

A custom page named **Patient Appointment Dashboard** was created in the UI Builder. It contains a heading and subtitle, summary cards, three charts, and the Appointment Schedule Report.

Dashboard component	Purpose
Patient Appointment Overview panel	Displays the dashboard title and a short description.
Total Patient Registrations card	Shows the total number of registered patient records (3 in the captured dashboard).
New Consultations card	Shows the number of records categorized as new consultations (1 in the captured dashboard).
Follow-up Appointments card	Shows the number of records categorized as follow-up appointments (2 in the captured dashboard).
Patients by Department chart	Pie chart groups records by department, including General Medicine and Cardiology.
Appointments by Type chart	Column chart compares record counts by appointment type.
Preferred Appointment Dates chart	Column chart displays the number of records grouped by preferred appointment date/month.
Appointment Schedule Report	Shows patient name, department, preferred date, preferred time and appointment type.

5. Procedure

Step 1. Opened the Patient Appointment Booking System in Zoho Creator.

Step 2. Reviewed the Patient Registrations report and created an Appointment Schedule Report using the patient name, department, preferred date, preferred time and appointment type fields.

Step 3. Opened the UI Builder and created a custom page named Patient Appointment Dashboard.

Step 4. Added a heading panel with the title Patient Appointment Overview and a subtitle describing the purpose of the dashboard.

Step 5. Added summary cards for Total Patient Registrations, New Consultations and Follow-up Appointments.

Step 6. Added a pie chart to group patient records by Department.

Step 7. Added a column chart to compare records by Appointment Type and another chart to summarize Preferred Appointment Dates.

Step 8. Embedded the Appointment Schedule Report in the dashboard to display the appointment records in a table.

Step 9. Corrected missing Appointment Type values in the sample records and checked that the chart displayed New Consultation and Follow-up categories instead of Unknown.

6. Results and Observations

The dashboard displayed 3 patient registrations, 1 new consultation and 2 follow-up appointments in the captured view. The department chart showed records grouped into General Medicine and Cardiology. The appointment-type chart displayed New Consultation and Follow-up categories after the missing values were corrected. The schedule report showed three records with patient names, departments, preferred dates, preferred times and appointment types.

7. Screenshots

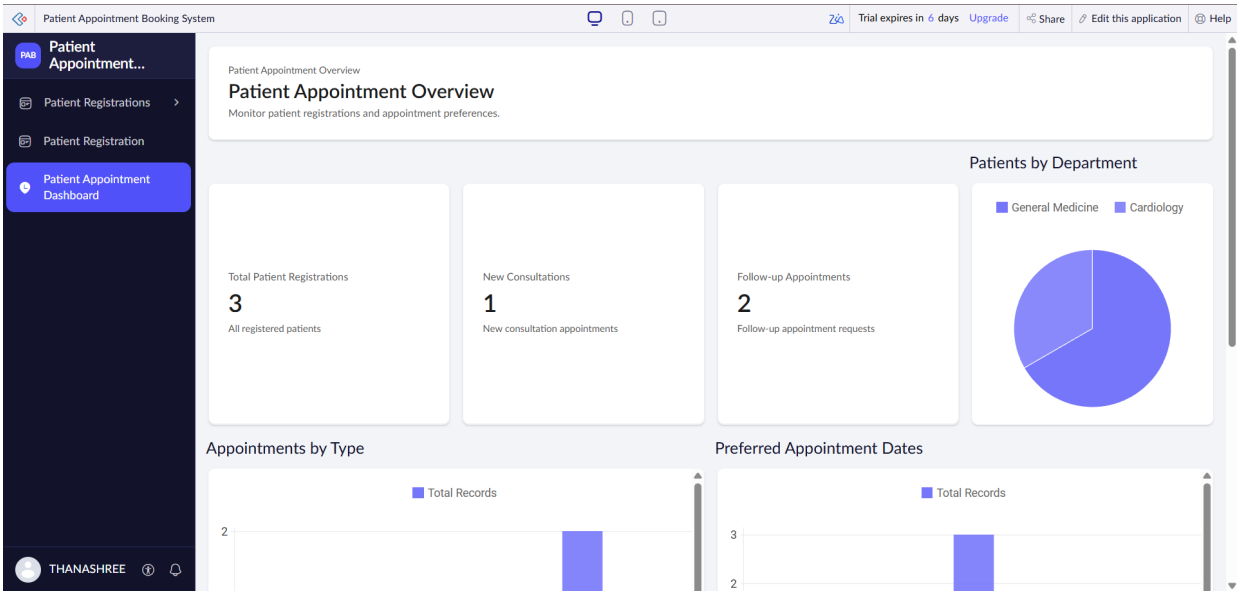

Figure 1. Patient Appointment Dashboard showing the heading, summary cards and charts.

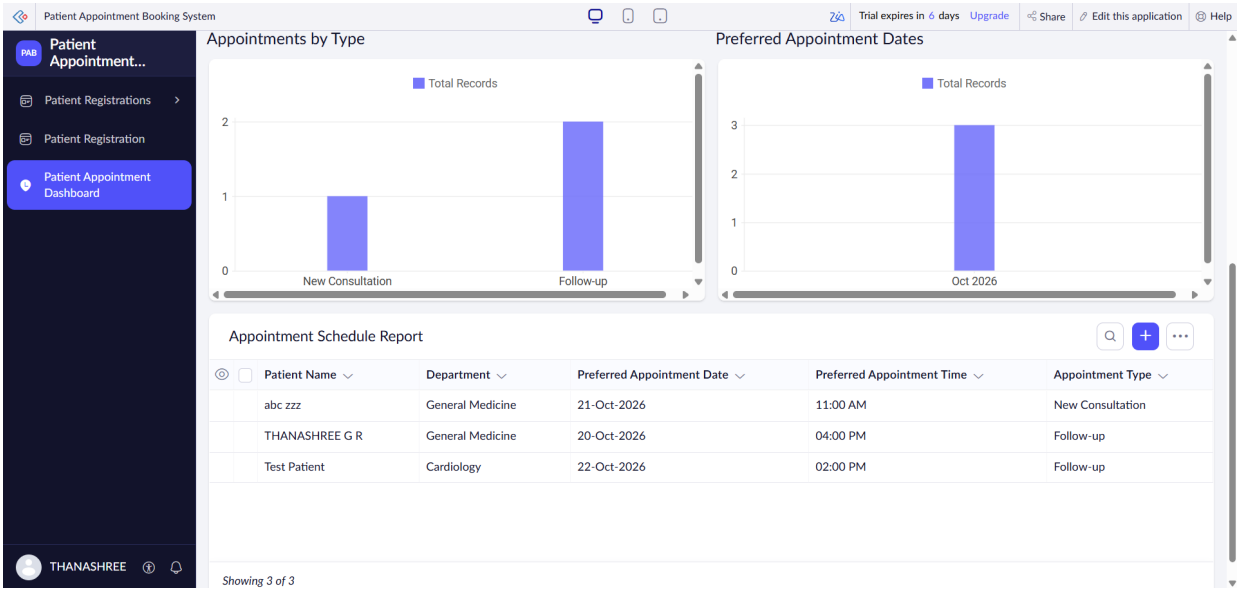

Figure 2. Dashboard charts and Appointment Schedule Report with three records.

8. Conclusion

The experiment successfully demonstrated how Zoho Creator reports and UI Builder components can be combined to present patient registration and appointment information. Summary cards provide quick counts, charts visualize records by department, appointment type and preferred date, and the embedded schedule report provides detailed appointment information in tabular form.

9. Learning Outcome

7. Screenshots (continued)

Figure 3 shows the Appointment Schedule Report opened directly in Zoho Creator. It includes the patient name, department, preferred appointment date, preferred appointment time, and appointment type for all three sample records.

Learning outcome: Practical experience was gained in creating reports, embedding reports in a custom page, arranging dashboard components, creating charts from form data, and reviewing application records through a unified dashboard.
